

Four control problems organize the research programme

Each problem ties mature parent methods (filled square) to an observable scientific decision, names one cross-layer failure (x) and two measurable quantities (open diamond) - definitions, not measurements.

† bibliographic correction applied to this row's canonical source during the 2026-08-29 citation audit (one detail still unpinpointed for ref 38).

Filled square = parent method; x = cross-layer failure mode; open diamond = measurable quantity (definition, not measurement).
